

ABSTRACT OF THE DISCLOSURE

5 A crimping apparatus comprises a pair of frames; a pair  
of crimpers each provided centrally in each frame; pairs of  
connector tables each provided movably in a longitudinal  
direction on each frame; locking means for securing the  
connector tables on both ends of each frame; moving means  
for moving each said connector table along the frame; and  
10 a pair of connector holding poles in each of which a  
plurality of connectors are arranged to be settable on each  
the connector table. Thus, a large number of kinds of  
sub-harnesses can be manufactured.
